What are your learning goals for the semester?

Learn about app development on mobile platform.

What are you most excited about?

Launching my app on Google Play!

What are you worried about?

The pace of the class. I understand the class needs to cover many topics. It's just that sometimes jumping too fast between each topic might be hard to catch along.

Time commitment for this class. This semester my schedule is very tight and I hope the time commitment on homework to be around 6 hours every week, the amount reasonable for a 4-credit class.

The balance between content taught by the teaching team and content left for us to explore. I'd love to learn more from the amazing teaching team in class instead of vast open studio time in the first two months.

What would you like the teaching team to know about your previous experiences (informal or formal) with software or independent studying that would help us plan for the term?

I'm very comfortable coding in Java and I took OlinJS before.
